Holdfinger

The revolution of control

The Revolution is here.

# HOLDFINGER

is a ground-breaking device that allows doctors to simultaneously move endoscopic accessories and directly manage their operation. Full operational control is achieved using a single hand, with no need for assistants.

HOLDFINGER features a specific locking system, which is reversible, fast, easy and user - friendly. It is compatible with many endoscopy accessories and allows using the "single operator" technique over different procedures.

HOLDFINGER allows moving the accessory backwards and forwards thanks to the specific locking system and it's unique, ergonomic design. The device can be easily fitted on the tip of a single finger, so the operator can use the same hand to manage and operate the accessory handle.

## Discover HOLDFINGER

According to current techniques, most colonoscopists employ an assistant to control some of the crucial aspects of device operation during snare polypectomy, endoscopic mucosal resection and endoscopic sphincterotomy interventions. By allowing highly coordinated, single operator-controlled handling of the devices, HOLDFINGER plays a role in preventing potential complications, reducing procedural time and costs.

## Benefits

Lower direct intervention costs

Shorter intervention times

Human resources reallocation

Shorter assistant time

More control for the endoscopist

Minimized complications
